Abstract:

This study investigates different factors in sustainable healthcare systems adopting low-resource healthcare systems. The topic under investigation is Sustainable Care and Health Systems Research: Towards Better Health and Health Equity in low-resource settings. Data was then obtained through questionnaires to identify the effects of sustainable measures, including renewable energy resource use, telemedicine, and disease prevention, on enhancing access to efficient health care. It also points to the importance of such approaches in preventing compromise or worsening healthcare disparities, improving healthcare service delivery, and integrating sustainable environmental policies. The implementation process is analyzed, and information on barriers such as financial limits or technical difficulties is provided. The research offers a conceptual map to inform policy changes and policy innovations in reimagining sustainable, equitable systems of health and well-being for human societies across the globe.

Keywords:

Sustainable healthcare, global health equity, low-resource settings, healthcare access.
